NEDO human CDNA sequencing project supported by Ministry of Economy, Trade and Industry of Japan; CDNA full insert sequencing:

Research Association for Biotechnology (RAB); CDNA library

Construction: Helix Research Institute (HRI) (supported by Japan Key Technology Center etc.); S-, & 3'-end one pass sequencing: RAB, FNI, and Biotechnology Center, National Institute of Technology and Evaluation; clone selection for full insert sequencing: HRI and RAB; annotation: HRI and RAB.

RAB; annotation: HRI and RAB.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed,

and is derived by analysis of the total score distribution.

```
The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAA38642-AAM42213) with nootropic, immunosuppressant and cytostatic acitvity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease. Huntington's diseases, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and section. The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries -
                                                                                                                                                                                                                                                                                                                      Ren F, W

Claim 1; Page 449-450; 1095pp; English.

```
This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence encodes a polypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          214 TACCAGAAAGCAGCTGAAGAACAAACATGGAGAAGAAGAAGTAACACCGAAAATCTC 273

                                                                                                                                                                                                                                                                                                      Dipid-associated proteins (LIPAP) can be used for treating or preventing disorders associated with decreased expression of LIPAP, or streaming for agonists or antagonists of LIPAP, and to raise specific antibodies. Antagonists and antagonists of LIPAP are useful for treating diseases associated with reduced or increased levels of LIPAP, e.g. cardiovascular, neurological and gastrointestinal diseases and disorders of lipid metabolism. Fragments of the nucleic acid encoding LIPAP are useful for detection of full length coding sequences, in hybridization and/or amplification assays or for diagnosis or monitoring. Nucleocides encoding LIPAP are used to screen for compounds that specifically modify LIPAP expression, for recombinant production of LIPAP, in gene therapy, as a source of therapeutic antisense, triplex-forming, or ribozyme agents and for therapeutic mapping. Antibodies to the proteins are used for diagnosis and monitoring of LIPAP-associated disease by immunoassay, as an antification of natural LIPAP.

Leach M; Shimkets RA,

WPI; 2000-602362/57. P-PSDB; AAB42934. Novel nucleic acids and peptides derived from open reading frame X, useful for treating e.g. cancers, proliferative disorders, neurodegenerative disorders and cardiovascular disease

Claim 5; Page 4578-4580; 5507pp; English.

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; sequences have activities such as: cytostatic; hepatotropic; vulnerary; cattiporalizitic; anticonvulsant; antiathritic; immunosuppressant; cardiant; thrombolytic; coagulant; vasotropic; municosuppressive; antidobetic; hypotensive; dermatological; immunosuppressive; antitherenia, protectail; antiviral; antichengl; antitherenia, antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX proteins in gene therapy cardinated to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthitis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus crymentosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, coagulation; to inhibit thrombosis; and as a contraceptive.

Claim 4; Page 43-44; 59pp; English.

The present sequence encodes a human EPLIN (epithelial protein lost in neoplasm)-beta isoform. The specification also describes EPLIN-alpha. EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to used in screening assays to detect molecules that specifically bind to as agonist or antagonist of EPLIN, in particular molecules that affect cell proliferation. Thus the assays are useful for screening molecules with potential ultility as anticancer drugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polynucleotides are useful in gene therapy techniques. EPLIN is useful as a marker that

and a copy and a solid party and as

EPLIN is a tumour suppressor protein, whose expression is altered in multiple common human tumour types. EPLIN nucleic acids and proteins are used in screening assays to detect molecules that specifically bind to EPLIN nucleic acids, proteins or derivatives and thus have potential use as agonist or antagonist of EPLIN, in particular molecules that affect and protiferation. Thus the assays are useful for screening molecules with potential utility as anticancer duugs or lead compounds for drug development. EPLIN nucleic acids, proteins are useful for detecting a cell proliferative disorder in a subject. EPLIN polymucleotides are useful in gene therapy techniques. EPLIN is useful as anarker that can be diagnostically, prognostically and therapeutically used over the course of a cell proliferative disorder associated with EPLIN.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                195
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           215
    The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human high agnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       aguences. (I) is useful as hybridisation probes, caction (PCR) primers, ollogomers, and for chromosome and in recombinant production of (II). The recombinant production of (II). The recombinant production of (II). The recombinant production of sequence tags spressed sequence tags activity of (II) as useful in gene therapy techniques activity of (II) or to treat disease states involving ful for generating antibodies against it, detecting or typeptide in tissue, as molecular weight markers and as (II) and its binding partners are useful in medical expressing (II). (I) and (II) are useful for treating abserrant protein expression or biological activity.

The process for preparing the polypeptide, the application of the polypeptide in treating diseases such as cancer, the antagonist of the polypeptide and its medical function and the application of the polynucleotide.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypetides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as historialsed neuropathies and central nervous system diseases, such as lateral sclerosis, and SNy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                 Novel nucleic acids and polypeptides, useful for treating disorders

Five hundred and ninety two polynucleotides derived from a variety of human tissue sources which encode secreted proteins, useful for treating immune deficiencies and disorders such as autoimmune disorders

Resnick RJ;

Claim 1; Page 279-280; 372pp; English.

The invention relates to 592 polynucleotides which have been derived from a variety of human tissue sources and which encode novel secreted a variety of human tissue sources and which encode novel secreted controls. The polynucleotides can be used as probes for the reaction and isolation of full length cDNA and genomic DNA. The identification and isolation can also be used as nutritional supplements. The proteins are useful in the treatment of various immune deficiencies and disorders such as viral infections, bacterial infections, fungal infections, autoimmune disorders (e.g. rheumatoid architis, multiple sclerosis, autoimmune thyroidits and diabetes) and allergic reactions and conditions (e.g. asthma). They are also useful for treating controdegenerative diseases (e.g. Alzheimers (e.g. haemophilia), confitammenty disorders (e.g. Alzheimers (e.g. haemophilia), confitammenty disorders (e.g. Alzheimers (e.g. haemophilia), cuseful for tissue regeneration, for wound healing and in the treatment of burns, incisions and ulcers. The proteins are also useful for regulating chaematopoiesis and for treating myeloid or lymphoid cell deficiencies.

The present invention describes primer sets for synthesising 5602

(11)-length cDNAs defined in the specification. Where a primer set

(2) an oligo-dT primer and an oligouncleotide complementary

(3) comprises. (4) an oligo-dT primer and an oligouncleotide complementary

(4) complementary strand of a polynucleotide which comprises one of

(5) configuration of an east 15 nucleotides; or (b) a combination

(6) complementary strand of a polynucleotide which comprises a 5'-end

(7) complementary strand of a polynucleotide which comprises a 5'-end

(8) sequence and an oligonucleotide comprising a sequence complementary to a

(8) complementary strand of a polynucleotide which comprises a 5'-end

(9) complementary strand of a polynucleotide which comprises a 1'-end sequence. Where the

(9) complementary strand of a polynucleotide complementary to a

(10) complementary strand of a polynucleotide sond the combination of

(11) complementary strand of a polynucleotide sond the sequence of

(12) complementary strand of a polynucleotide sond the specification. The primers are useful for synthesising polynucleotides,

(13) complementary full-length cDNAs. The primers are also useful for the

(14) complementary specialised methods. AAH13628 and

(15) complementary strand of a phormality of the full-length

(16) complementary strand of a phormality of the strain second by

(17) cDNAs easily without any specialised methods. AAH33629 to AAH13632

(18) complementary specialised methods. AAH33629 to AAH36322

(18) complementary specialised methods. AAB35833

(18) complementary specialised methods. AAB3532

(18) complementary specialised methods. AAB35832

(18) complementary specialised methods. AAB35832

(18) complementary specialised methods. AAB35246

(18) complementary specialised m
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1057
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        328
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                757
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          348

This invention describes novel human nucleic acid sequences from normal breast tissue which have cytostatic activity. The nucleic acid sequences can be used to produce and isolate full-length gene sequences. They can be used to express proteins, which can be used as tools to find an activity against breast cancer. The sequences can be used in sense or antisense form. They are especially useful for medicaments for gene therapy to treat breast cancer and for treating illnesses associated with fat metabolism.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LysSerGluvalGlnGlnProvalHisProLysProLeuSerProAspSerArgAlaSer 368
                              The invention relates to a novel human sterol regulatory element binding protein 3 (hSREBP-3) expressed in human normal hypothalamic tissue and its coding sequence. Also described is the process for preparing the protein and nucleic acid sequence, and the method for detecting hSREBP-3 nucleic acid sequence and polypeptides. The present sequence represents the coding sequence of human hSREBP-3 as described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SerLeuSerGluserSerProProLysalaMetLysLysPheGlnAlaProAlaArgGlu 388

The polynucleotide sequences given in AAC59499 to AAC59497 encode the human secreted proteins given in AAB3402 to AAB34140. AAB34141 to AAB3416 represent human secreted polypeptide sequences and proteins convenient to the exemplification of the present invention. Human secreted proteins have activities based on the tissue and calls the genes are expressed in. Examples of activities include: and calls the genes are expressed in. Examples of activities include: and calls immunosuppressive, antiheumatic, antiproliferative; cytostatic; immunosuppressive, articheumatic, antiproliferative; cytostatic; ardiant; vasotropic; creebrovective; nootropic; crebits, gats, norses, and volvations of the present condition in e.g. humans, mice, and vulnerary. The polynucleotides and polypeptides can be used to parbological condition or susceptibility to a pathological condition or susceptibility to a pathological condition. Disorackers which are diagnosed or treated include concern the breast or liver, cardiovascular disorders, crebrovascular concern of the breast or liver, cardiovascular disorders, crebrovascular disorders, angiogenesis, nervous system disorders and polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to Claim 1; Page 357-358; 419pp; English

transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC59440 to AAC59448 and AAB34091 represent sequences used
